WORK IN PROGRESS

Building FMS to run a club entirely on data

A single platform to run a football club from the ground up. It brings together club operations, unified football data, and the analytics that turn it into decisions, all built on a completely data-driven approach.

Muhad, full stack engineer & football data scientist muhadk.vercel.app muhadkprsnl@gmail.com

Club operations

Player profiles, staff, training, medical, and contracts that make up the day-to-day running of the club.

Unified data layer

External providers like event, tracking, and scouting data, normalized into one common data model.

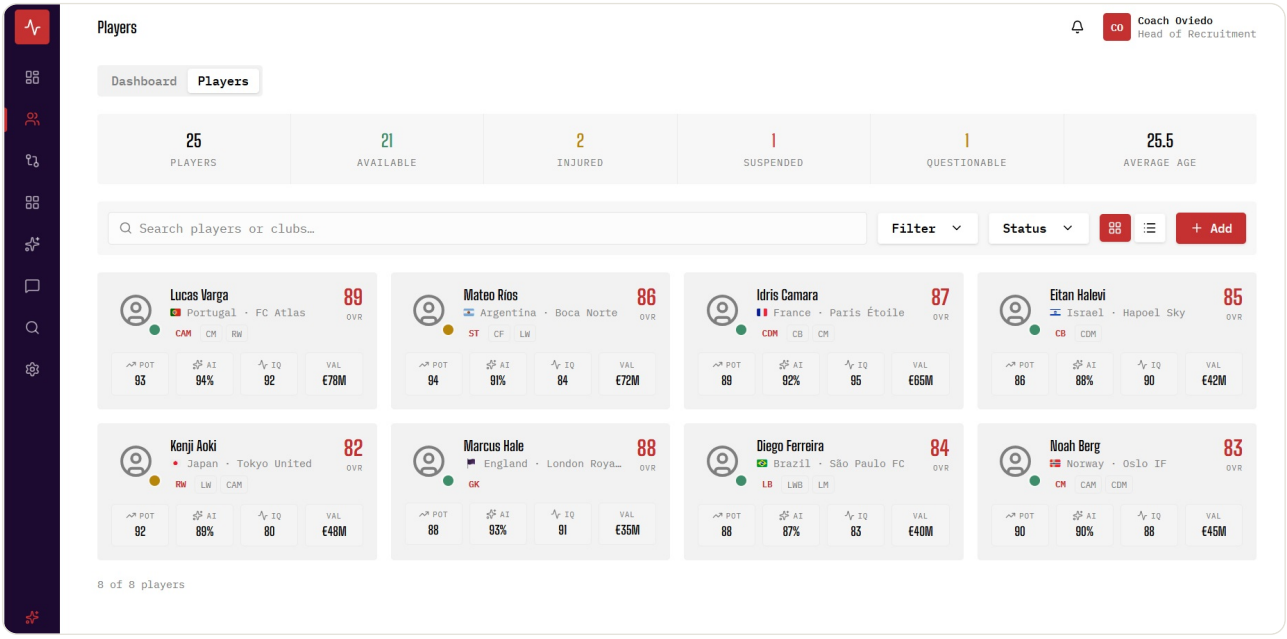

Intelligence

Analytics, AI/ML, and statistical models that turn raw data into recruitment and performance decisions.

What's already built: the player module

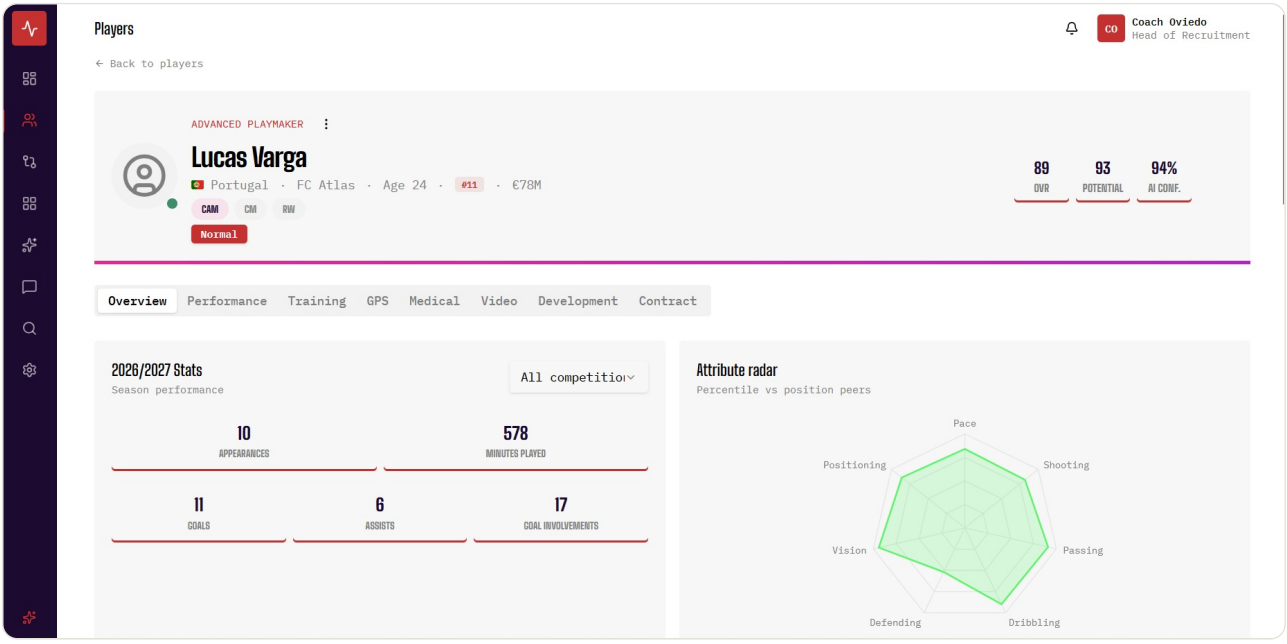

The player module is fully built out across seven tabs: overview, performance, training, GPS, medical, video, and

development. Every other module in the diagram above is designed but not yet implemented.

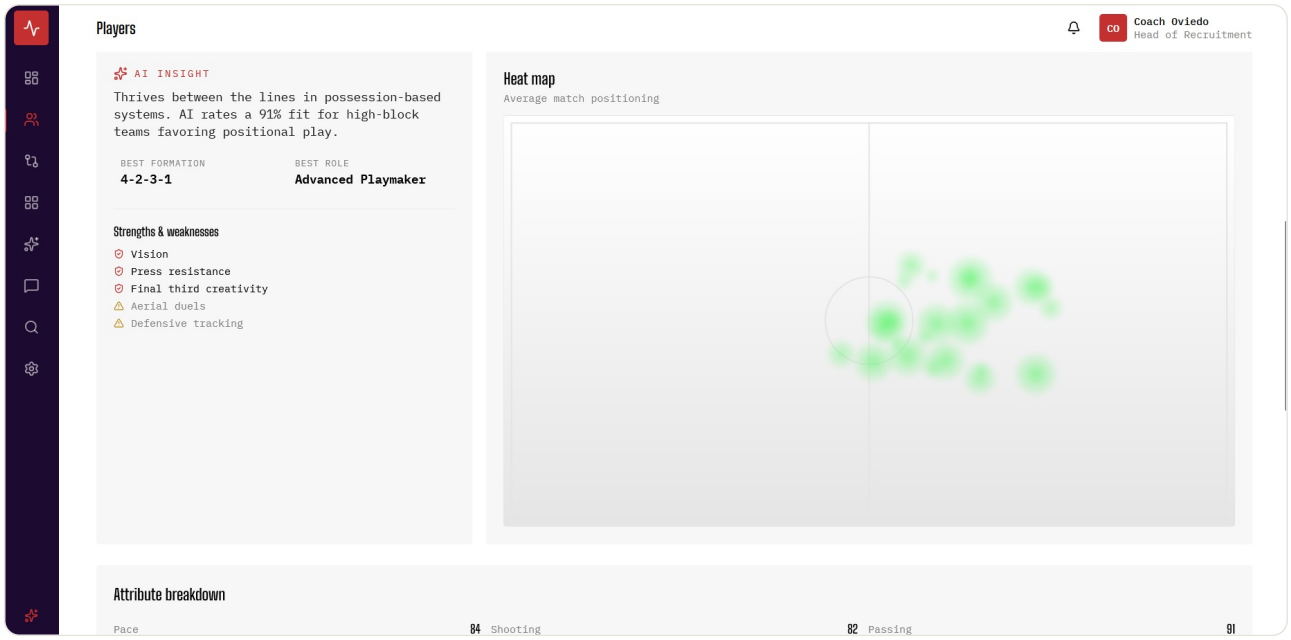

Player module: squad overview

The entry point into the player module. Full squad list with availability status, overall rating, potential, AI confidence, and market value at a glance.

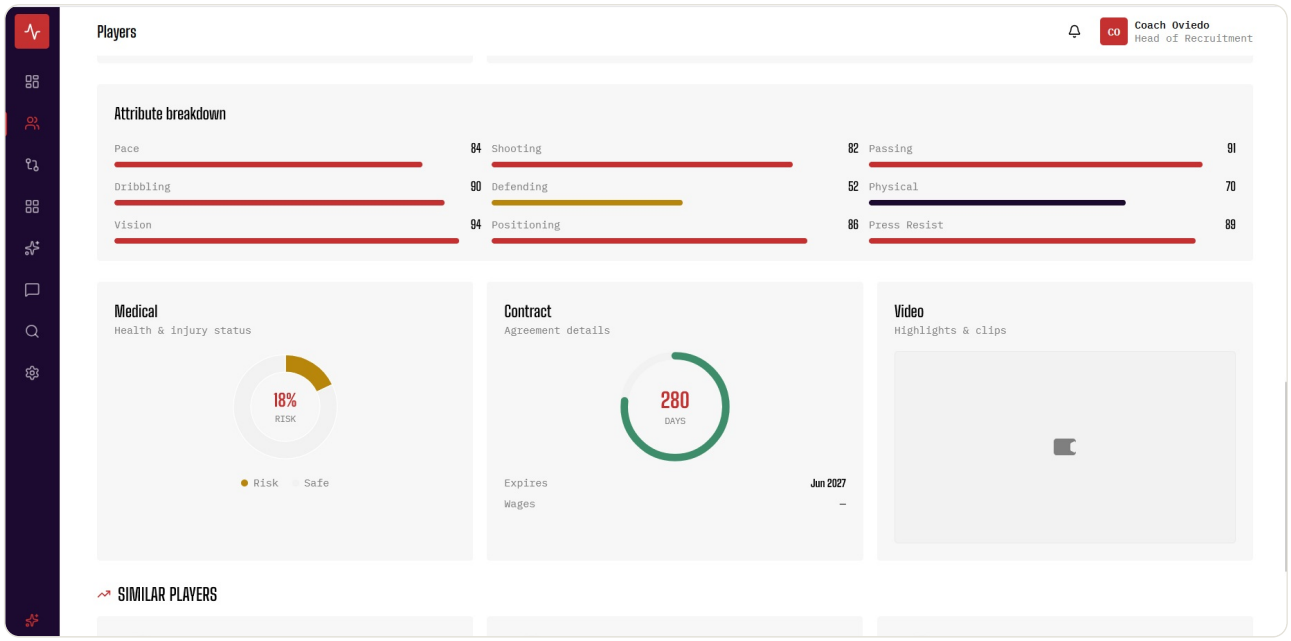

Overview tab: season stats & attribute radar

The primary season stats card next to a 7-dimensional attribute radar (pace, shooting, passing, dribbling, defending, vision, positioning), benchmarked against positional peers.

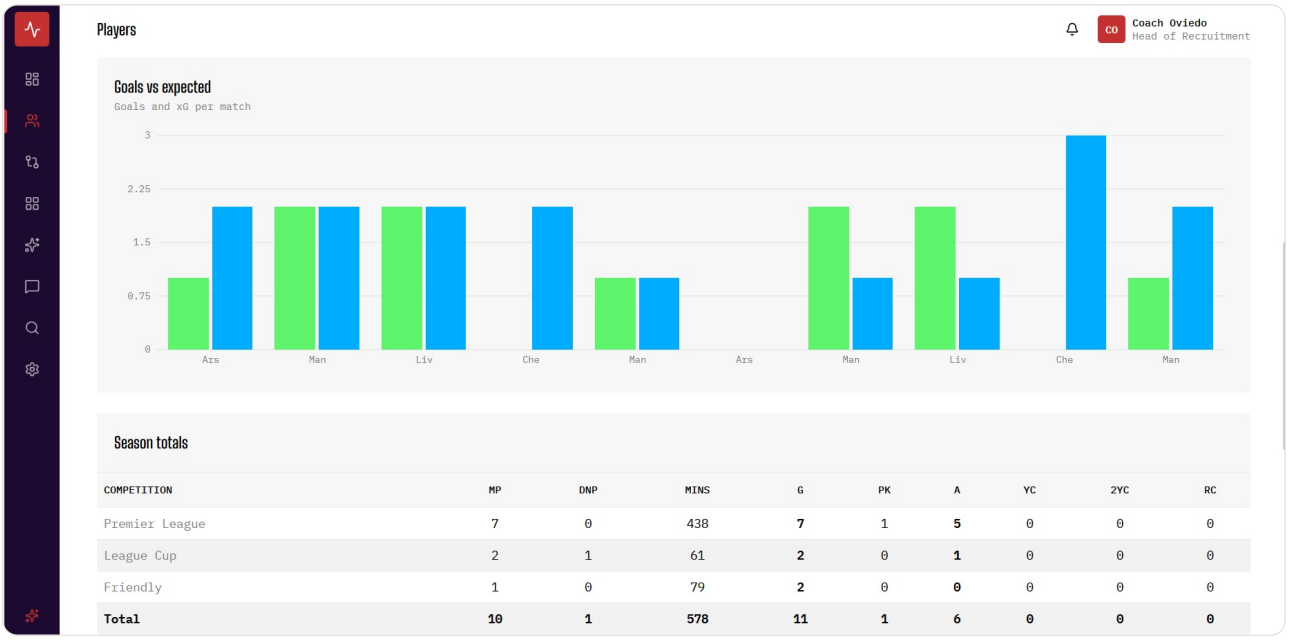

Overview tab: AI insights & heatmap

AI-generated read on playing style, strengths and weaknesses, best formation, and best role, paired with a heatmap of average match positioning.

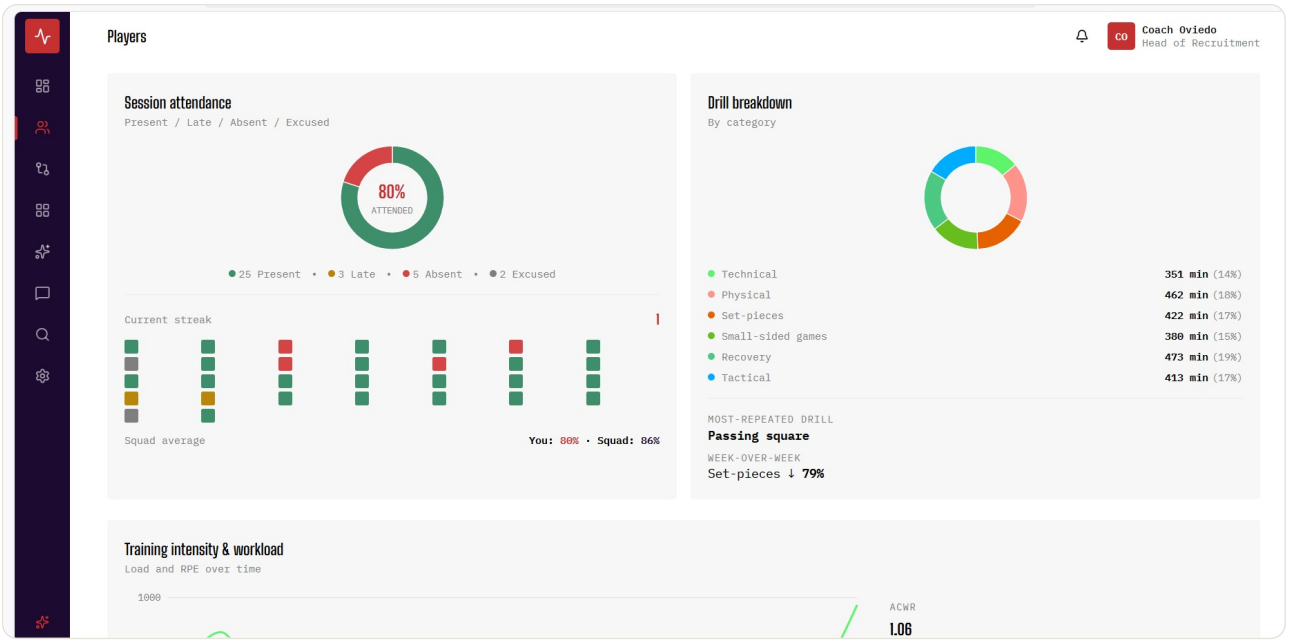

Overview tab: attributes, medical & contract

The full 9-attribute breakdown with progress bars, an injury-risk donut, a contract countdown, and a video highlights placeholder, rounding out the overview tab alongside similar-player recommendations.

Performance tab: goals vs. expected

Match-by-match goals against xG, with a season totals table broken down by competition, alongside a match log and rating trend elsewhere in the tab.

Training tab: attendance, drills & workload

Session attendance as a donut and streak calendar, a drill-type breakdown by category, and the start of the training intensity and workload (ACWR) chart.

The module also includes a dedicated GPS tab (movement zones, distance, deceleration load), a full medical tab (availability status and injury history), a video tab, and a development tab (goals, progress tracking, scout notes), not all pictured above.

What's next: the scouting module

A position- and formation-aware pipeline that turns raw scouting data into a projection of a young player's future potential.

1. Scouting data

Event, tracking, and provider feeds, already normalized by the unified data layer.

2. Positional dimensions

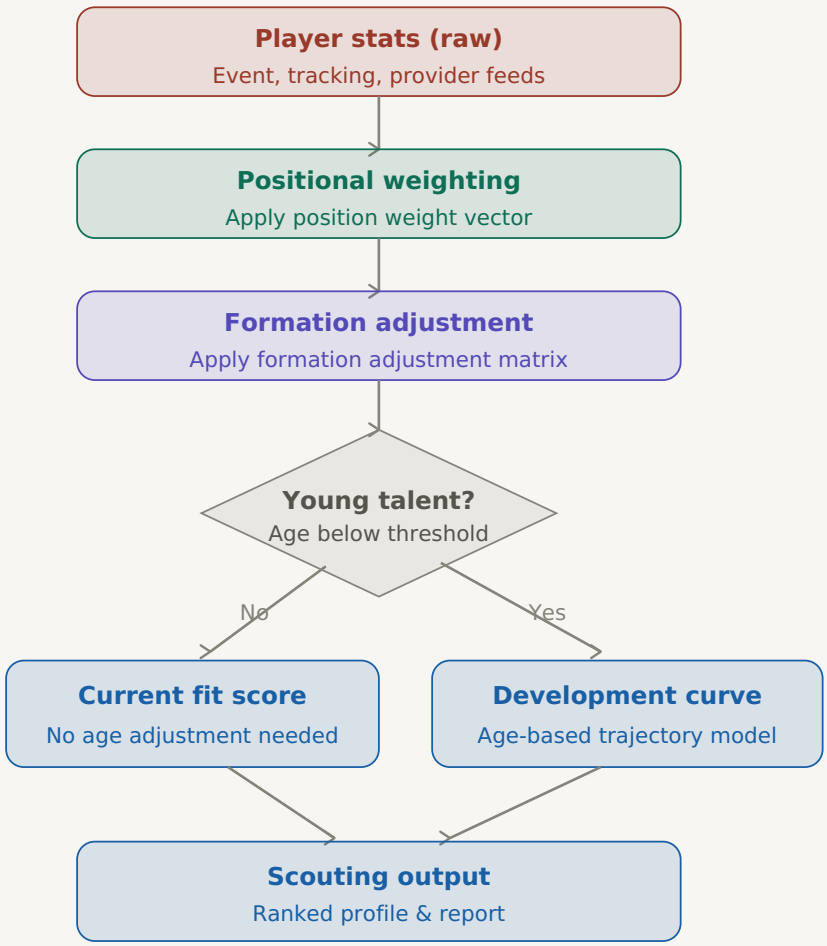

The same raw stats re-weighted depending on the player's position, since a CB and a CAM aren't scored on the same attributes.

3. Formation context

The positional profile adjusted again for the specific system, because a full-back in a back-4 needs different qualities than a wing-back in a back-3.

4. Talent prediction

A projection of trajectory, showing how a young player's current numbers are likely to evolve given typical development curves for that position.

This is the club operations layer taking shape. Player management, training, medical, and contracts are already in place, with the first threads of an intelligence layer already running on top. The unified football data layer and the deeper analytical engine, including the scouting pipeline above, come next, turning event, tracking, and scouting feeds from multiple providers into one consistent model the whole platform can reason over.

Built on a Python / FastAPI backend with PostgreSQL, and a fully React + Tailwind frontend.
